

Multi ISP Management

AnexGATE supports variety of WAN connectivity from Dial up/ ISDN/ Dual WAN links. Dual WAN links can be configured to ensure that business applications continue to run, even if one link fails. Even dial up link could be fail over link for customers, who don't opt for two different ISP broadband connections.

The WAN connections can be configured in the following manner:

- a. Fail over
- b. Load balancing

In first case, all traffic is routed through the first link and second link automatically becomes active, if first link goes down.

In the case of load balancing, both links are utilized at the same time.

The graphical reports of WAN link usage indicate performance of the links and their utilizations.
